TITLE: E.  $\underline{\text{coli}}$  and Streptomyces host cells that contain MatBC genes or E.  $\underline{\text{coli}}$  host cells that contain pcc genes useful for enhanced polyketide production

DATE-ISSUED: September 6, 2005

US-CL-CURRENT: 435/76; 435/252.33, 435/252.35

#### ABSTRACT:

The use of enzymes that catalyze the production of starter and extender units for polyketides in E. <a href="coli">coli</a> and Streptomyces is described; these enzymes include malonyl CoA decarboxylase (MatA), malonyl CoA synthetase (MatB), and a malonate transporter (MatC) as well as proprionyl CoA carboxylase (pcc). The matBC gene from Streptomyces coelicolor, the matABC genes from Rhizobium trifoli, and the pccB and accA2 from Streptomyces coelicolor are useful in specific embodiments of the claimed invention. These enzymes may be used to enhance the yield of polyketides that are natively produced or polyketides that are rationally designed. By using these techniques, the synthesis of a complete polyketide has been achieved in E. <a href="coli">coli</a> in the presence of a phosphopantetheinyl transferase, such as sfp from Bacillus subtilis. This achievement permits a host organism with desirable characteristics to be used in the production of such polyketides and to assess the results of gene shuffling.

## ABSTRACT:

This invention provides detailed sequence analysis and characterization of the gene cluster responsible for the synthesis of bleomycin in Streptomyces verticillus. The

bleomycin gene cluster provides the first hybrid polyketide synthase/nonribosomal peptide synthetase pathway and elucidation of the various modules and enzymatic domains characterizing the pathway provides convenient synthetic routes for bleomycins, bleomycin analogs, and various other polyketides.

TITLE: Genes and proteins involved in the biosynthesis of enedigne ring structures

DATE-ISSUED: June 28, 2005

**INVENTOR-INFORMATION:** 

NAME CITY STATE ZIP CODE COUNTRY

Farnet; Chris M. Outremont CA
Staffa; Alfredo Saint-Laurent CA
Zazopoulos; Emmanuel Montreal CA

US-CL-CURRENT: 702/20; 530/350, 536/23.7

#### ABSTRACT:

Five protein families cooperate to form the warhead structure that characterizes enediyne compounds, both chromoprotein enediynes and non-chromoprotein enediynes. The protein families include a polyketide synthase and thioesterase protein which form a polyketide synthase catalytic complex involved in warhead formation in enediynes. Genes encoding a member of each of the five protein families are found in all enediyne biosynthetic loci. The genes and proteins may be used in genetic engineering applications to design new enediyne compounds and in methods to identify new enediyne biosynthetic loci.

#### ABSTRACT:

Combinatorial libraries of polyketides can be obtained by suitable manipulation of a host <u>modular polyketide synthase</u> gene cluster such as that which encodes the PKS for picromycin. The combinatorial library is useful as a source of pharmaceutically active compounds. In addition, novel polyketides and antibiotics are prepared using this method.

ABSTRACT:

Modified PKS gene clusters which produce novel polyketides in an efficient system in a host cell or in a cell free extract are described. The novel polyketides result from the incorporation of diketides of the formula ##STR1##

wherein A is a moiety that activates the diketide, and at least one of R.sup.1 and R.sup.2 is a substituent other than that natively occurring in the diketide normally processed by the modified PKS cluster. The polyketides may also be glycosylated to provide antibiotics.

#### ABSTRACT:

Hybrid and novel polyketide synthases (PKSs) and polyketides are produced by use of a multiple vector system. The combinatorial possibilities offered by placing the various catalytic activities of PKS systems on separate vectors permits the construction of improved libraries of PKS and polyketides. In addition, polyketides can be produced in hosts that ordinarily do not produce polyketides by supplying, along with an expression system for the desired PKS, an expression system for holo acyl carrier protein (ACP) synthase.

ABSTRACTED-PUB-NO: US 6033883A BASIC-ABSTRACT:

A recombinant host cell is modified to contain an <u>expression</u> system (ES) for a minimal <u>polyketide synthase</u> (PKS) and an ES for a holo acyl carrier protein (ACP) synthase. The minimal PKS comprises: (a) a ketosynthase/acyl transferase (KS/AT) catalytic region, a chain-length factor (CLF) catalytic region and an ACP activity for an aromatic PKS; or (b) a KS catalytic region, an AT region, and an ACP activity for a modular or fungal PKS.

Also claimed are: (1) a recombinant host cell modified to contain either: (a) at least 2 vectors (V1 and V2), where V1 contains a first selectable marker and a

first ES and V2 contains a second selectable marker and a second ES; the ESs are effective to produce at least a minimal PKS; or (b) at least one vector and a modified chromosome, the one vector containing a first selectable marker and a first ES and the modified chromosome containing a second ES, where the ESs in combination are effective to produce at least a minimal PKS as described above; (2) a library of PKSs or synthesised polyketides which comprises a panel of individual colonies, each colony containing either (a) or (b) as in (1), where the combination of vectors or of vector(s) and modified chromosome is different in each colony; (3) a vector containing a selectable marker operable in yeast or E.coli, and an ES which comprises the coding region of at least one functional PKS catalytic activity operably linked to a promoter, adapted for expression in yeast or E.coli; and (4) a yeast or E. coli cell modified to contain a vector as in (3).

USE - The host cells are used for the production of polyketides such as macrolide antibiotics, e.g. erythromycin, spiramycin and tylosin, immunosuppressants such as rapamycin and FK506, antiparasitics such as the avermectins, antifungal agents such as amphotericin B and nystatin, anticancer agents such as daunorubicin and doxorubicin and anticholesterolemics such as mevinolin.

ADVANTAGE - The use of multiple vectors provides a more efficient way to enhance the number of combinatorial forms of PKS and polyketides that can be prepared. By supplying an ES for a compatible holo ACP synthase either on a separate vector, on one of the vectors in a multiple vector system (or on a single vector for PKS expression), or as a fusion protein with a PKS or portion, hosts such as E. coli, yeast, and other microbial systems which do not customarily synthesize polyketides can be made into convenient hosts.

ABSTRACTED-PUB-NO:

#### US 6258566B EQUIVALENT-ABSTRACTS:

A recombinant host cell is modified to contain an <u>expression</u> system (ES) for a minimal <u>polyketide synthase</u> (PKS) and an ES for a holo acyl carrier protein (ACP) synthase. The minimal PKS comprises: (a) a ketosynthase/acyl transferase (KS/AT) catalytic region, a chain-length factor (CLF) catalytic region and an ACP activity for an aromatic PKS; or (b) a KS catalytic region, an AT region, and an ACP activity for a <u>modular or fungal</u> PKS.

Also claimed are: (1) a recombinant host cell modified to contain either: (a) at least 2 vectors (V1 and V2), where V1 contains a first selectable marker and a first ES and V2 contains a second selectable marker and a second ES; the ESs are effective to produce at least a minimal PKS; or (b) at least one vector and a modified chromosome, the one vector containing a first selectable marker and a first ES and the modified chromosome containing a second ES, where the ESs in combination are effective to produce at least a minimal PKS as described above; (2) a library of PKSs or synthesised polyketides which comprises a panel of individual colonies, each colony containing either (a) or (b) as in (1), where the combination of vectors or of vector(s) and modified chromosome is different in each colony; (3) a vector containing a selectable marker operable in yeast or E.coli, and an ES which comprises the coding region of at least one functional PKS catalytic activity operably linked to a promoter, adapted for expression in yeast or E.coli; and (4) a yeast or E. coli cell modified to contain a vector as in (3).

USE - The host cells are used for the production of polyketides such as macrolide antibiotics, e.g. erythromycin, spiramycin and tylosin, immunosuppressants such as rapamycin and FK506, antiparasitics such as the avermectins, antifungal agents such as amphotericin B and nystatin, anticancer agents such as daunorubicin and doxorubicin and anticholesterolemics such as mevinolin.

ADVANTAGE - The use of multiple vectors provides a more efficient way to enhance the number of combinatorial forms of PKS and polyketides that can be prepared. By

supplying an ES for a compatible <u>holo ACP synthase</u> either on a separate vector, on one of the vectors in a multiple vector system (or on a single vector for PKS <u>expression</u>), or as a fusion protein with a PKS or portion, hosts such as E. <u>coli, yeast</u>, and other microbial systems which do not customarily synthesize polyketides can be made into convenient hosts.

A recombinant host cell is modified to contain an <u>expression</u> system (ES) for a minimal <u>polyketide synthase</u> (PKS) and an ES for a holo acyl carrier protein (ACP) synthase. The minimal PKS comprises: (a) a ketosynthase/acyl transferase (KS/AT) catalytic region, a chain-length factor (CLF) catalytic region and an ACP activity for an aromatic PKS; or (b) a KS catalytic region, an AT region, and an ACP activity for a <u>modular or fungal</u> PKS.

Also claimed are: (1) a recombinant host cell modified to contain either: (a) at least 2 vectors (V1 and V2), where V1 contains a first selectable marker and a first ES and V2 contains a second selectable marker and a second ES; the ESs are effective to produce at least a minimal PKS; or (b) at least one vector and a modified chromosome, the one vector containing a first selectable marker and a first ES and the modified chromosome containing a second ES, where the ESs in combination are effective to produce at least a minimal PKS as described above; (2) a library of PKSs or synthesised polyketides which comprises a panel of individual colonies, each colony containing either (a) or (b) as in (1), where the combination of vectors or of vector(s) and modified chromosome is different in each colony; (3) a vector containing a selectable marker operable in yeast or E.coli, and an ES which comprises the coding region of at least one functional PKS catalytic activity operably linked to a promoter, adapted for expression in yeast or E.coli; and (4) a yeast or E. coli cell modified to contain a vector as in (3).

USE - The host cells are used for the production of polyketides such as macrolide antibiotics, e.g. erythromycin, spiramycin and tylosin, immunosuppressants such as rapamycin and FK506, antiparasitics such as the avermectins, antifungal agents such as amphotericin B and nystatin, anticancer agents such as daunorubicin and doxorubicin and anticholesterolemics such as mevinolin.

ADVANTAGE - The use of multiple vectors provides a more efficient way to enhance the number of combinatorial forms of PKS and polyketides that can be prepared. By supplying an ES for a compatible <a href="https://example.com/holo-ACP-synthase">holo-ACP-synthase</a> either on a separate vector, on one of the vectors in a multiple vector system (or on a single vector for PKS <a href="expression">expression</a>), or as a fusion protein with a PKS or portion, hosts such as E. <a href="exoliging-color: coliging-color: coliging-color: coliging-color: coliging-color: coliging-color: coliging-color: coliging-color: color: coliging-color: color: coliging-color: color: coliging-color: color: color: coliging-color: color: co

# US 6399789B

NOVELTY - Expressing a polyketide or non-ribosomal peptide (I) in a host cell (II) employing a number of integrative or freely replicating recombinant vectors (III), each encoding a portion of polyketide synthase (PKS) or non-ribosomal peptide synthase (NRPS) to produce (I), comprises introducing (III) into (II) and culturing (II), such that (I) is produced.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- (1) a compound (IV) selected from the group of compounds given in the specification; and
- (2) a compound (IVa) obtainable by hydroxylation and/or glycosylation of (IV).

USE - The method is useful for producing polyketides and non-ribosomal peptides (claimed).

Page 11 of 12

ADVANTAGE - The method is suitable for creating large libraries of polyketides, non-ribosomal proteins, and mixed polyketides. The method enables the realization of the full potential of <a href="modular">modular</a> PKSs and NRPSs, and thus libraries containing a complete repertoire of (I). The method requires only the construction of a limited number of highly <a href="modular">expressing</a> productive single mutants that will assure adequate polyketide production when the mutants are combined.

DESCRIPTION OF DRAWING(S) - The figure shows the macrolactones produced by Streptomyces lividans strains containing assorted combinations of three plasmids, pKOS010-153, pKOS038-67 and pKOS021-30.
